Your Vision as an Engineer

The ideals that inspire me for the engineering profession are being both creative and persevering. Creativity plays a part when it comes down to finding a more efficient solution towards a current problem in the industry. Additionally, perseverance allows for figuring out solutions for issues that have yet to be resolved. The ideals that would inspire other engineers and get them to be interested in my ideals as an engineer would have to be open-mindedness and patience. Open-mindedness allows a future or current engineer to continue exploring his or her options, while patience allows one to let the process happen at the pace appropriate for the individual. What makes my dream unique about being an engineer is my relentless drive for continuous self-improvement, whether that be personally or professionally. In today's world, competition for jobs and profit has never been higher than before, and it is of utmost importance to prioritize the growth of oneself in every possible way.

The future I envision for my stakeholders and for the greater organization would be one that is prosperous for all, as a good environment can lead to increased success from an economic perspective and business perspective. In my opinion, building up a good environment would range from a couple of years to several years as the organization continues to expand. This vision serves the common good as everyone involved benefits in some sort of way, whether it be financially, professionally, or mentally. The artifacts that I can provide that would appeal to others would be technical diagrams that simplify complex ideas into more digestible ones and help elevate my organization's mission.
